

*Luxury* Bath Systems

Your Eco-Friendly  
Remodeling Choice

***Luxury Bath Systems offers a new, environmentally friendly alternative to conventional remodeling.***

Traditional bathroom remodeling requires demolition and removal of old bathtubs, tile, walls and plumbing. Over 700 pounds of non-biodegradable materials, including steel, porcelain, fiberglass, gypsum, brass, plasticized papers and often lead, are added to local landfills from just one reconstruction.

The new construction materials used to rebuild bathrooms today are made from ceramic with fiberglass resins. Although production is regulated by various agencies, levels of toxic fumes and acetone are released into the air daily. These new bathtubs are not recyclable and will require landfill burial in future years.
